The background of the slide is a complex, abstract composition. It features a dark, muted purple or brownish background. Overlaid on this are several geometric and data-like elements: a network of thin, light-colored lines forming a mesh or web-like structure; numerous small, green and blue dots scattered across the field; and a grid of small, light-colored plus signs. In the upper left, there are some faint, stylized symbols that look like mathematical or logical notations. A large, white, semi-transparent banner with a slight 3D effect is positioned horizontally across the middle of the slide, serving as a backdrop for the title text.

Lecture 9. Pattern- Based Classification

Lecture 9. Pattern-Based Classification

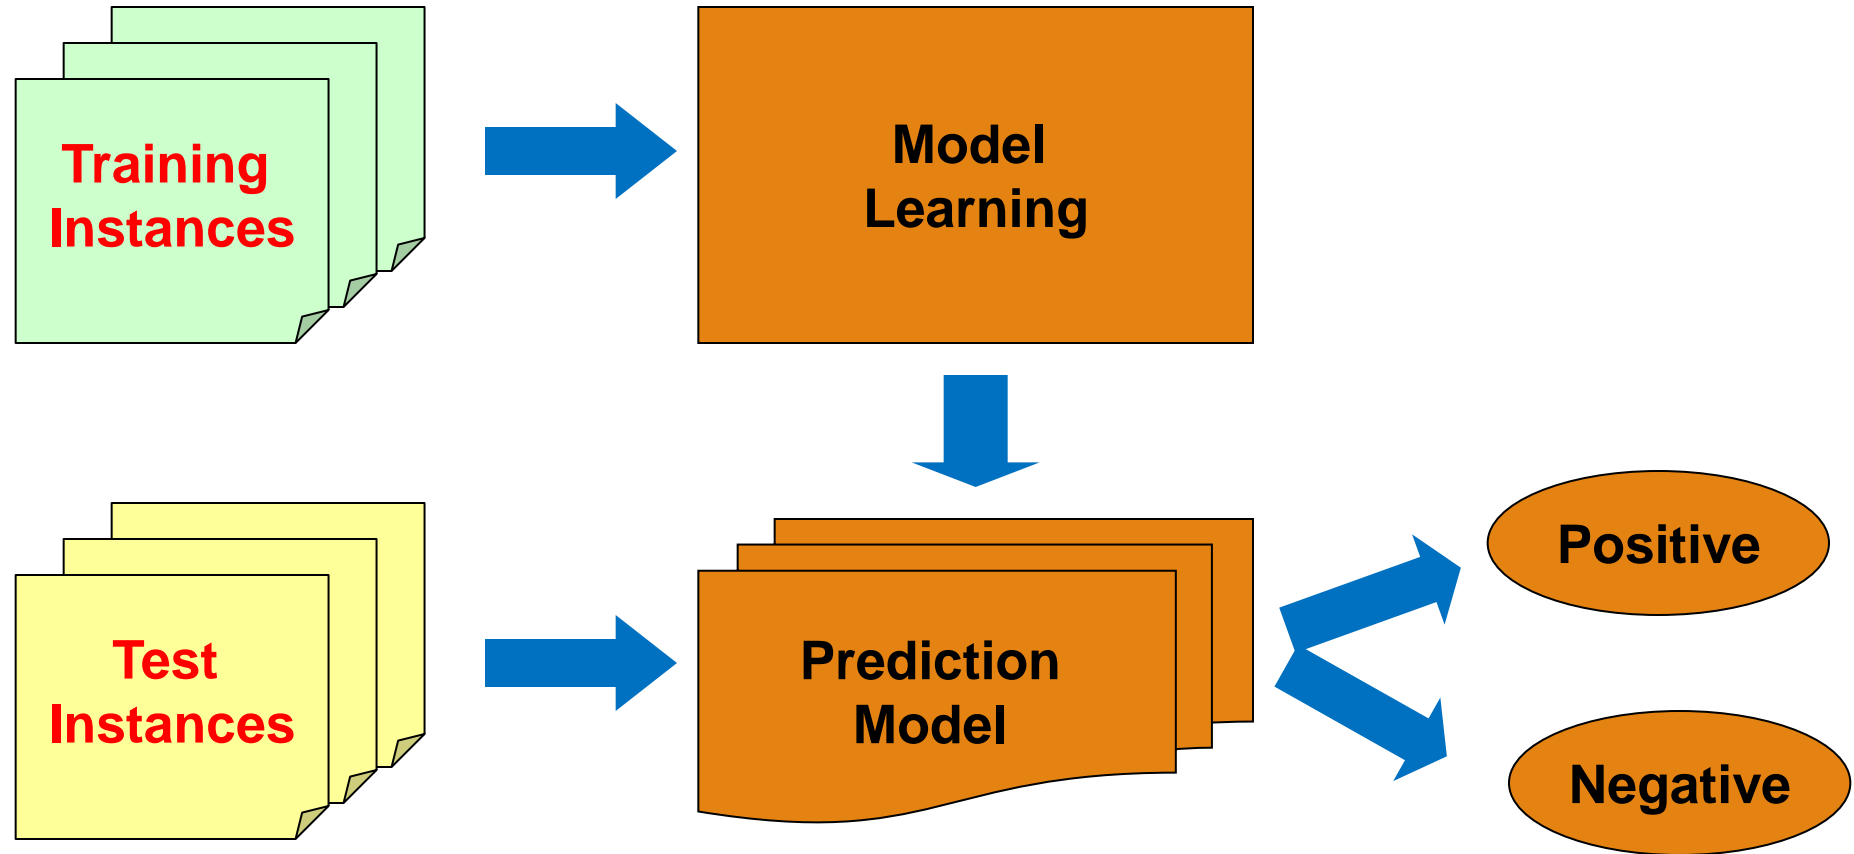

- ❑ Classification: Basic Concepts
- ❑ Pattern-Based Classification
- ❑ Associative Classification
- ❑ Discriminative Pattern-Based Classification
- ❑ Direct Mining of Discriminative Patterns

Thanks to Hong Cheng@CUHK for her contributions

The background of the slide is a complex, abstract composition. It features a dark, muted purple or brownish background overlaid with a network of thin, light-colored lines that form a web-like structure. Scattered throughout this network are numerous small, colored dots in shades of green, blue, and orange. In the upper left corner, there is a rectangular inset showing a different pattern of dots, primarily in shades of orange and red, arranged in a more structured, grid-like fashion. The overall aesthetic is technical and data-driven, suggesting themes of network science, machine learning, or data visualization.

Numerous Classification Applications

The background of the slide is a complex, abstract composition. It features a dark, muted purple or brownish background overlaid with a network of thin, light-colored lines that form a web-like structure. Scattered throughout this network are numerous small, colored dots in shades of green, blue, and orange. In the upper left corner, there is a horizontal band containing a series of small, light-colored plus signs (+) and some faint, illegible text. In the lower left corner, there is a rectangular inset showing a cluster of orange and red dots, with a horizontal bar of pink and white squares overlaid on it. The overall aesthetic is technical and data-driven.

Session 2. Pattern-Based Classification

Pattern-Based Classification, Why?

- ❑ **Pattern-based classification:** An integration of both themes
- ❑ **Why pattern-based classification?**
 - ❑ **Feature construction**
 - ❑ Higher order; compact; discriminative
 - ❑ E.g., single word → phrase (Apple pie, Apple i-pad)
 - ❑ **Complex data modeling**
 - ❑ Graphs (no predefined feature vectors)
 - ❑ Sequences
 - ❑ Semi-structured/unstructured Data

Pattern-Based Classification on Graphs

1	1	0

Associative or Pattern-Based Classification

- ❑ **Data:** Transactions, microarray data, ... → **Patterns or association rules**
- ❑ **Classification Methods** (Some interesting work):
 - ❑ CBA [Liu, Hsu & Ma, KDD'98]: Use high-conf., high-support *class association rules* to build classifiers To be discussed here
 - ❑ Emerging patterns [Dong & Li, KDD'99]: Patterns whose support changes significantly between the two classes
 - ❑ CMAR [Li, Han & Pei, ICDM'01]: Multiple rules in prediction To be discussed here
 - ❑ CPAR [Yin & Han, SDM'03]: Beam search on multiple prediction rules
 - ❑ RCBT [Cong et al., SIGMOD'05]: Build classifier based on mining top-k covering rule groups with row enumeration (for high-dimensional data)
 - ❑ Lazy classifier [Veloso, Meira & Zaki, ICDM'06]: For a test t , project training data D on t , mine rules from D_t , predict on the best rule
 - ❑ Discriminative pattern-based classification [Cheng et al., ICDE'07] To be discussed here

The background of the slide is a complex, abstract composition. It features a network of thin, light-colored lines forming a web-like structure. Overlaid on this are various data visualization elements: a grid of small grey plus signs, clusters of green and blue dots, and a prominent orange and red cluster on the left side. The overall color palette is muted, with earthy tones and soft pastels.

Session 3. Associative Classification: CBA and CMAR

CBA: Classification Based on Associations

- ❑ CBA [Liu, Hsu and Ma, KDD'98]
- ❑ Method
 - ❑ Mine high-confidence, high-support class association rules
 - ❑ LHS: conjunctions of attribute-value pairs; RHS: class labels
 $p_1 \wedge p_2 \dots \wedge p_l \rightarrow "A_{\text{class-label}} = C"$ (confidence, support)
 - ❑ Rank rules in descending order of confidence and support
 - ❑ Classification: Apply the first rule that matches a test case; o.w. apply the default rule
 - ❑ Effectiveness: Often found more accurate than some traditional classification methods, such as C4.5
 - ❑ Why? — Exploring high confident associations among multiple attributes may overcome some constraints introduced by some classifiers that consider only one attribute at a time

CMAR: Classification Based on Multiple Association Rules

- ❑ Rule pruning whenever a rule is inserted into the tree
 - ❑ Given two rules, R_1 and R_2 , if the antecedent of R_1 is more general than that of R_2 and $\text{conf}(R_1) \geq \text{conf}(R_2)$, then prune R_2
 - ❑ Prunes rules for which the rule antecedent and class label are not positively correlated, based on the χ^2 test of statistical significance
- ❑ Classification based on generated/pruned rules
 - ❑ If only *one rule* satisfies tuple X , assign the class label of the rule
 - ❑ If a *rule set* S satisfies X
 - ❑ Divide S into groups according to class labels
 - ❑ Use a weighted χ^2 measure to find the strongest group of rules, based on the statistical correlation of rules within a group
 - ❑ Assign X the class label of the strongest group
- ❑ CMAR improves model construction efficiency and classification accuracy

The background features a complex network of thin, light-colored lines forming a web-like structure. Scattered throughout are numerous small, colored dots in shades of green, blue, and orange. A prominent, darker, reddish-brown geometric shape, resembling a stylized letter 'A' or a complex polygon, is centered in the upper half. The overall aesthetic is technical and data-driven.

Session 4. Discriminative Pattern-Based Classification

Discriminative Pattern-Based Classification

- ❑ Discriminative patterns as features for classification [Cheng et al., ICDE'07]
- ❑ **Principle:** Mining discriminative frequent patterns as high-quality features and then apply any classifier
- ❑ **Framework (PatClass)**
 - ❑ Feature construction by *frequent itemset mining*
 - ❑ Feature selection (e.g., using **Maximal Marginal Relevance (MMR)**)
 - ❑ Select discriminative features (i.e., that are relevant but minimally similar to the previously selected ones)
 - ❑ Remove redundant or closely correlated features
 - ❑ Model learning
 - ❑ Apply a general classifier, such as SVM or C4.5, to build a classification model

On the Power of Discriminative Patterns

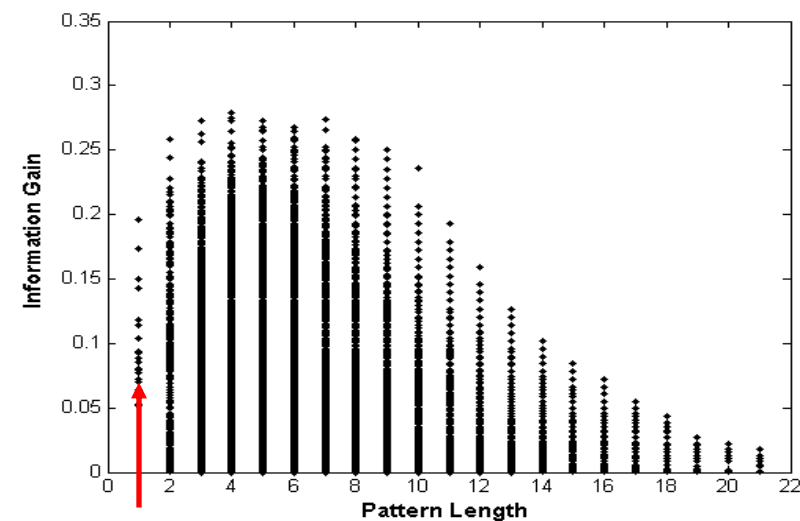

- ❑ K-itemsets are often more informative than single features (1-itemsets) in classification
- ❑ Computation on real datasets shows: The discriminative power of k-itemsets (for $k > 1$ but often ≤ 10) is higher than that of single features

(a) Austral

(b) Cleve

(c) Sonar

Information Gain vs. Pattern Length

Information Gain vs. Pattern Frequency

- Computation on real datasets shows: Pattern frequency (but not too frequent) is strongly tied with the discriminative power (information gain)
- Information gain upper bound monotonically increases with pattern frequency

Information Gain Formula: $IG(C | X) = H(C) - H(C | X)$

Entropy of
given data

$$H(C) = -\sum_{i=1}^m p_i \log_2(p_i)$$

Conditional entropy of
study focus

$$H(C | X) = \sum_j P(X = x_j) H(Y | X = x_j)$$

Discriminative Pattern-Based Classification: Experimental Results

Session 5. DDPMine: Direct Mining of Discriminative Patterns

Direct Mining of Discriminative Patterns

Frequent pattern mining, then getting discriminative patterns: Expensive

Direct mining of discriminative patterns : Efficient

DDPMine: Direct Discriminative Pattern Mining

- ❑ DDPMine [Cheng et al., ICDE'08]: Efficient, direct discriminative pattern mining
- ❑ **General methodology**
 - ❑ Input: A set of training instances D and a set of features F
 - ❑ Iteratively perform feature selectin based on the “**sequential coverage**” paradigm
 - ❑ Select the feature f_i with the highest discriminative power
 - ❑ Remove instances D_i from D covered by the selected feature f_i
- ❑ **Implementation**
 - ❑ Integration of **branch-and-bound search** with FP-growth mining
 - ❑ Iteratively eliminate training instances and **progressively shrink the FP-tree**

DDPMine: Branch-and-Bound Search

- The discriminative power (information gain) of a low frequency pattern is upper bounded by a small value
- During FPGrowth mining we record the most discriminative itemset discovered so far and its information gain value g_{best}
 - Before constructing a conditional FP-tree, we first estimate the upper bound of information gain based on the conditional DB
 - If the upper bound value $\leq g_{best}$, skip this conditional FP-tree and its subsequent trees

Upper bound-based FP-tree pruning

- Ex.: Prune b's cond. FP-tree if $\text{UpperBoundIG}(b) \leq \text{InfoGain}(a)$, where $\text{UpperBound IG}(b)$ is determined by b's support in its conditional DB
- DDPMine: A feature-based approach, i.e., mining only the most discriminative patterns

DDPMine Efficiency: Runtime Comparison

- Comparing three algorithms on classification efficiency (runtime in seconds)
 - PatClass: Discriminative-Pattern-Based Classification [Cheng et al., ICDE'07]
 - Harmony [Wang & Karypis, SDM'05]
 - DDPMine: Direct discriminative pattern mining [Cheng et al., ICDE'08]

- All three methods mine discriminative frequent patterns for effective classification
- DDPMine substantially improves mining efficiency

A Comparison on Classification Accuracy

- ❑ In comparison with Harmony and PatClass, DDPMine maintains high accuracy and substantially improves mining efficiency
- ❑ An extension of this methodology has been applied to software bug analysis (D. Lo, et al., "Classification of Software Behaviors for Failure Detection: A Discriminative Pattern Mining Approach", KDD'09)

Datasets	Harmony	PatClass	DDPMine
adult	81.90	84.24	84.82
chess	43.00	91.68	91.85
crx	82.46	85.06	84.93
hypo	95.24	99.24	99.24
mushroom	99.94	99.97	100.00
sick	93.88	97.49	98.36
sonar	77.44	90.86	88.74
waveform	87.28	91.22	91.83
Average	82.643	92.470	92.471

Summary

- ❑ Concepts of classification and pattern-based classification
- ❑ Associative classification methods, such as CBA and CMAR
- ❑ Discriminative pattern-based classification
